- Concluding Remarks

# What is the Mission of Jefferson Lab?

---

- Pursue basic research into the quark nature of the atomic nucleus.
- Map the geography of the transition from proton-neutron picture of nuclei to one based on quarks and gluons.
- Provide a testing ground for the theory of the color force Quantum Chromodynamics (QCD) and the nature of quark confinement.
- Probe the quark-gluon structure of hadronic matter and how it evolves within nuclei.

# What Do We Know?

- The Universe is made of quarks and leptons and the force carriers.

BOSONS			force carriers		
spin = 0, 1, 2, ...			spin = 0, 1, 2, ...

- The atomic nucleus is made of protons and neutrons bound by the strong force.
- The quarks are confined inside the protons and neutrons.
- Protons and neutrons are

# What is the Force?

- Quantum chromodynamics (QCD) looks like the right way to get the force at high energy.

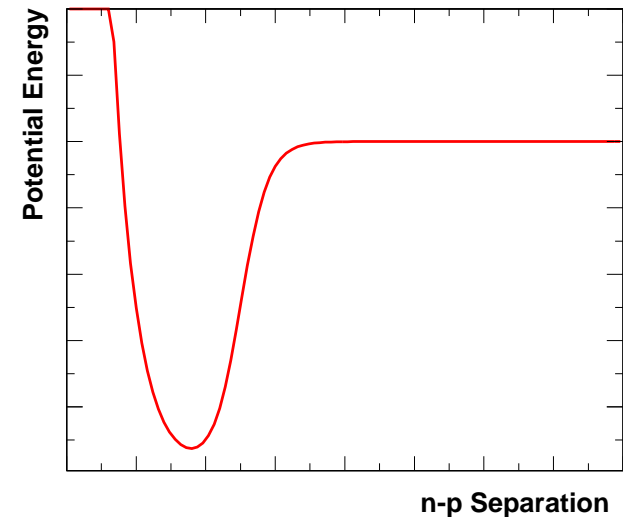

# What is the Force?

- Quantum chromodynamics (QCD) looks like the right way to get the force at high energy.

# What is the Force?

- Quantum chromodynamics (QCD) looks like the right way to get the force at high energy.
- The hadronic model uses a phenomenological force fitted to data at low energy. This 'strong' force is the residual force between quarks.

# How Well Do We Know It?

- We have a working theory of strong interactions: quantum chromodynamics or QCD (B.Abbott, *et al.*, Phys. Rev. Lett., **86**, 1707 (2001)).
- The coherent hadronic model (the standard model of nuclear physics) works too (L.C.Alexa, *et al.*, Phys. Rev. Lett., **82**, 1374 (1999)).

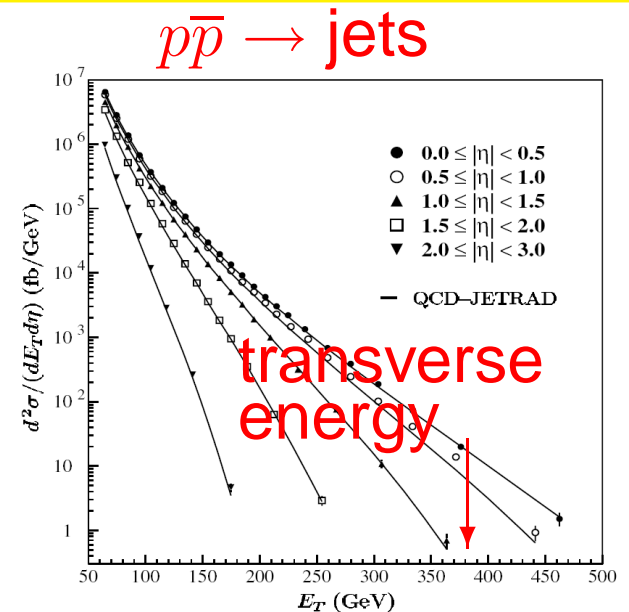

# How Well Do We Know It?

effective target area

- The coherent hadronic model (the standard model of nuclear physics) works too (L.C.Alexa, *et al.*, Phys. Rev. Lett., **82**, 1374 (1999)).

4-momentum transfer squared

# What Don't We Know?

- Matter comes in pairs of quarks or triplets.
- We are made mostly of the triplets (protons and neutrons).
- More than 99% of our mass is in nucleons.
- The proton is 2 ups + 1 down; the neutron is 1 up + 2 downs.
- How much does the proton weigh?

# What Don't We Know?

1. We can't get QCD and the hadronic model to line up -  
D. Abbott, *et al.*, Phys. Rev Lett. **84**, 5053 (2000).
2. NEED TO FIGURE OUT QCD AT THE ENERGIES OF NUCLEI!!

# The Magnetic Form Factor of the Neutron ( $G_M^n$ )

---

- Fundamental quantity related to the distribution of magnetization/currents in the neutron.
- Needed to extract the distribution of quarks in the neutron.
- Elastic form factors ( $G_M^n$ ,  $G_E^n$ ,  $G_M^p$ , and  $G_E^p$ ) provide key constraints on theory and the structure of hadrons.
- Part of a broad effort to understand how nucleons are ‘constructed from the quarks and gluons of QCD’.\*

\* ‘The Frontiers of Nuclear Science: A Long-Range Plan’,  
NSF/DOE Nuclear Science Advisory Committee, April, 2007.

# What is a Form Factor?

- Start with the cross section.

$$\frac{d\sigma}{d\Omega} = \frac{\text{scattered flux/solid angle}}{\text{incident flux/surface area}}$$

For elastic scattering use the Rutherford cross section.

# What is a Form Factor?

- Start with the cross section.

$$\frac{d\sigma}{d\Omega} = \frac{\text{scattered flux/solid angle}}{\text{incident flux/surface area}}$$

For elastic scattering use the Rutherford cross section.

- Get the cross section for elastic scattering by point particles with spin.

$$\frac{d\sigma}{d\Omega} = \frac{Z^2 \alpha^2 (\hbar c)^2}{4E^2 \sin^4(\theta/2)} \left(1 - \beta^2 \sin^2 \frac{\theta}{2}\right) \quad (\text{Mott cross section})$$

# What is a Form Factor?

where  $Q^2$  is the 4-momentum transfer.

**THE FORM FACTOR!**

# Why Should You Care?

---

- The chain of reason.

$$\frac{d\sigma}{d\Omega} \rightarrow |F(Q^2)|^2 \Leftrightarrow F(Q^2) \leftarrow \rho(\vec{r}) \leftarrow \psi(\vec{r}) \leftarrow \begin{array}{l} \text{QCD,} \\ \text{Constituent quarks} \end{array}$$

**Experiment**                  **Comparison**                                  **Theory**

The form factors are the meeting ground between theory and experiment.

- The Fourier transform of the form factors are related to the charge and current distributions within the neutron.

# Why Should You Care Even More?

- The old picture of the neutron (and proton).
- What we know now - analysis of form factor data by G. Miller (Phys. Rev. Lett. 99, 112001 (2007)).

# Why Should You Care Even More?

- The old picture of the neutron (and proton).
- What we know now - analysis of form factor data by G. Miller(Phys. Rev. Lett. 99, 112001 (2007)).

# How Do We Measure $G_M^n$ on a Neutron? (Step 1)

- Start at your local mile-long, high-precision, 6-GeV electron accelerator.
- The Continuous Electron Beam Accelerator Facility (CEBAF) produces beams of unrivaled quality.
- Electrons do up to five laps, are extracted, and sent to one of three experimental halls.
- All three halls can run simultaneously.

# How Do We Measure $G_M^n$ on a Neutron? (Step 2)

- Add one 45-ton, \$50-million radiation detector: the CE-BAF Large Acceptance Spectrometer (CLAS).
- CLAS covers a large fraction of the total solid angle.
- Has about 35,000 detecting elements in about 40 layers.

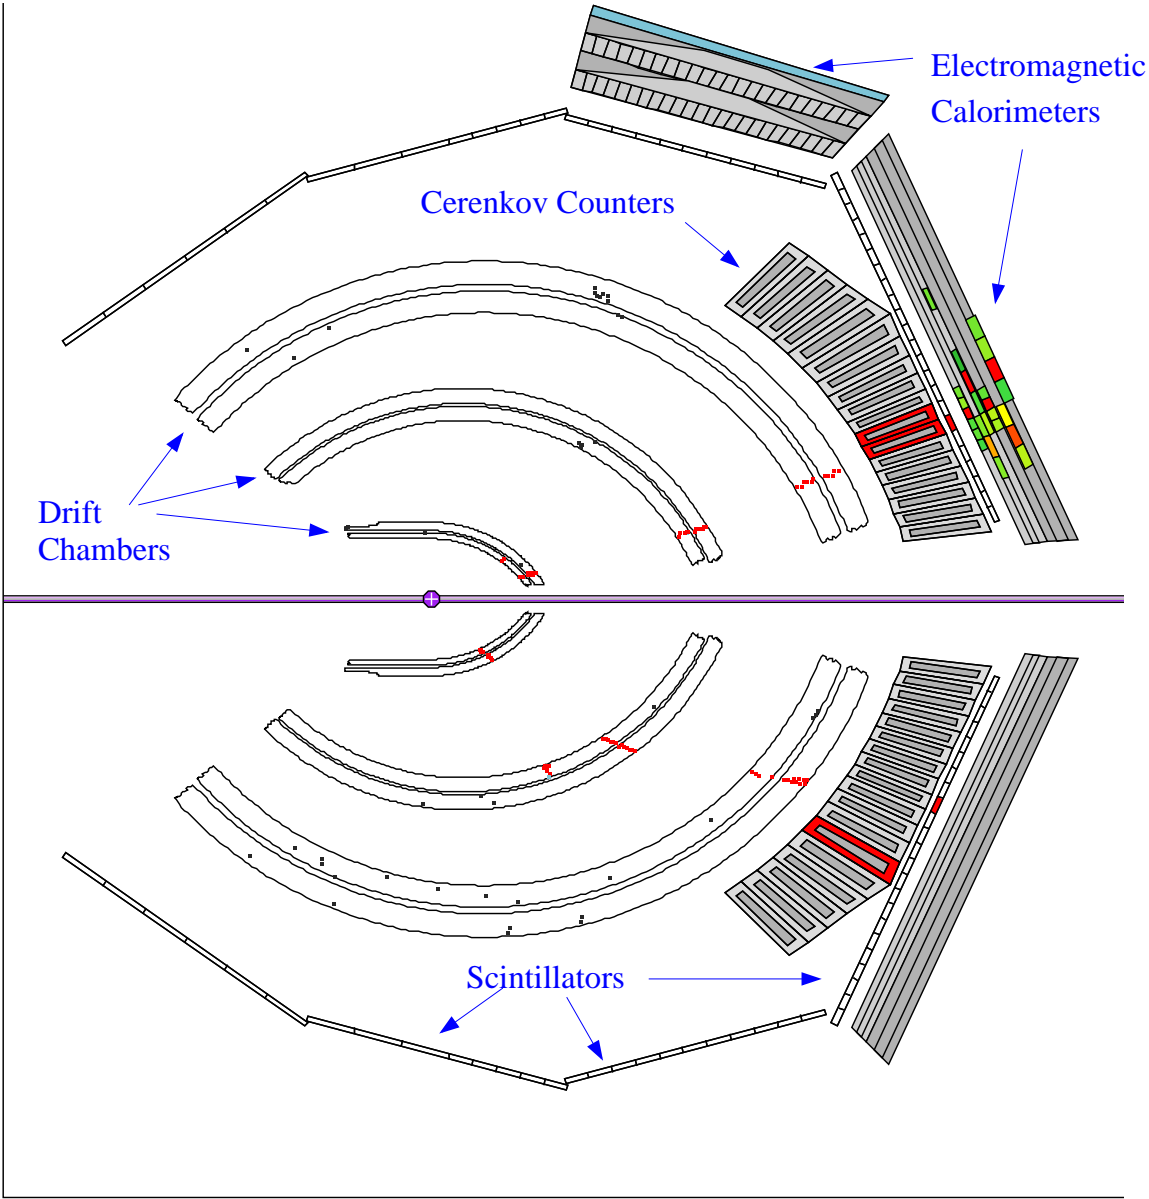

# How Do We Measure $G_M^n$ on a Neutron? (Step 2a)

- Drift chambers map the trajectories. A toroidal magnetic field bends the trajectory to measure momentum.
- Other layers measure energy, time-of-flight, and particle identification.
- Each collision is reconstructed and the intensity pattern reveals the forces and structure of the colliding particles.

# A CLAS Event

# How Do We Measure $G_M^n$ on a Neutron? (Step 3)

- Where's my target?

Use a dual target cell with liquid hydrogen and deuterium.

- How bad do the protons mess things up? They help!

$$R = \frac{\frac{d\sigma}{d\Omega}(D(e, e'n))}{\frac{d\sigma}{d\Omega}(D(e, e'p))} = a(Q^2) \frac{\frac{G_E^n^2 + \tau G_M^n^2}{1 + \tau} + 2\tau G_M^n^2 \tan^2(\frac{\theta}{2})}{\frac{G_E^p^2 + \tau G_M^p^2}{1 + \tau} + 2\tau G_M^p^2 \tan^2(\frac{\theta}{2})}$$

- The ratio is less vulnerable to corrections like acceptance, efficiencies, *etc.*
- Use the dual target to perform *in situ* detection calibrations.

# How Do We Measure $G_M^n$ on a Neutron? (Step 4)

- Quasi-elastic event selection: Apply a maximum  $\theta_{pq}$  cut to eliminate inelastic events plus a cut on  $W^2$  (J.Lachniet thesis).
- Use the  $ep \rightarrow e'\pi^+n$  reaction from the hydrogen target as a source of tagged neutrons in the TOF and calorimeter.

# Results - Overlaps and Final Average

Overlapping measurements of  $G_M^n$  scaled by the dipole are consistent.

# Results - Comparison with Existing Data

# Results - Comparison with Existing Data

# Nuclear Structure - Flavor Decomposition

- By measuring all four EEFFs we have an opportunity to unravel the contributions of the  $u$  and  $d$  quarks.
- Assume charge symmetry, no  $s$  quarks and use (Miller *et al.* Phys. Rep. **194**, 1 (1990))

$$F_{1(2)}^u = 2F_{1(2)}^p + F_{1(2)}^n$$

$$F_{1(2)}^d = 2F_{1(2)}^n + F_{1(2)}^p$$

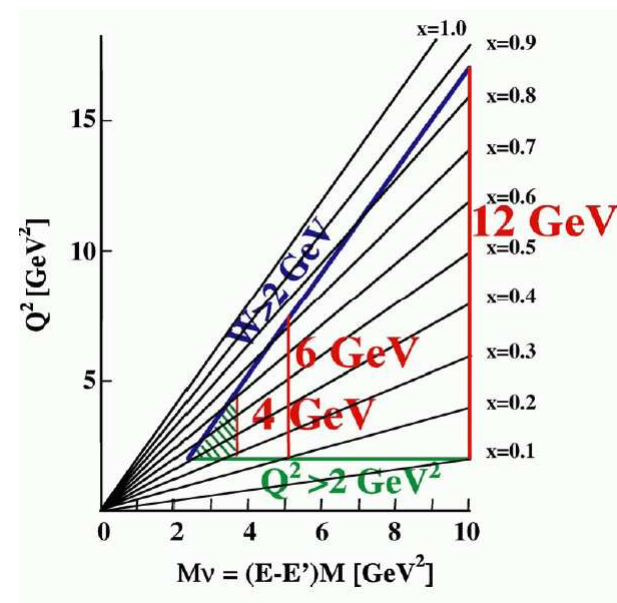

- $u$  and  $d$  are different.
- AND different from the proton and neutron form factors.
- Evidence of di-quarks,  $s$  quark influence, ...?

Gordon Cates, Sean Riordan  
*et al.*, PRL **106**, 252003 (2011).

# JLab 12-GeV Upgrade

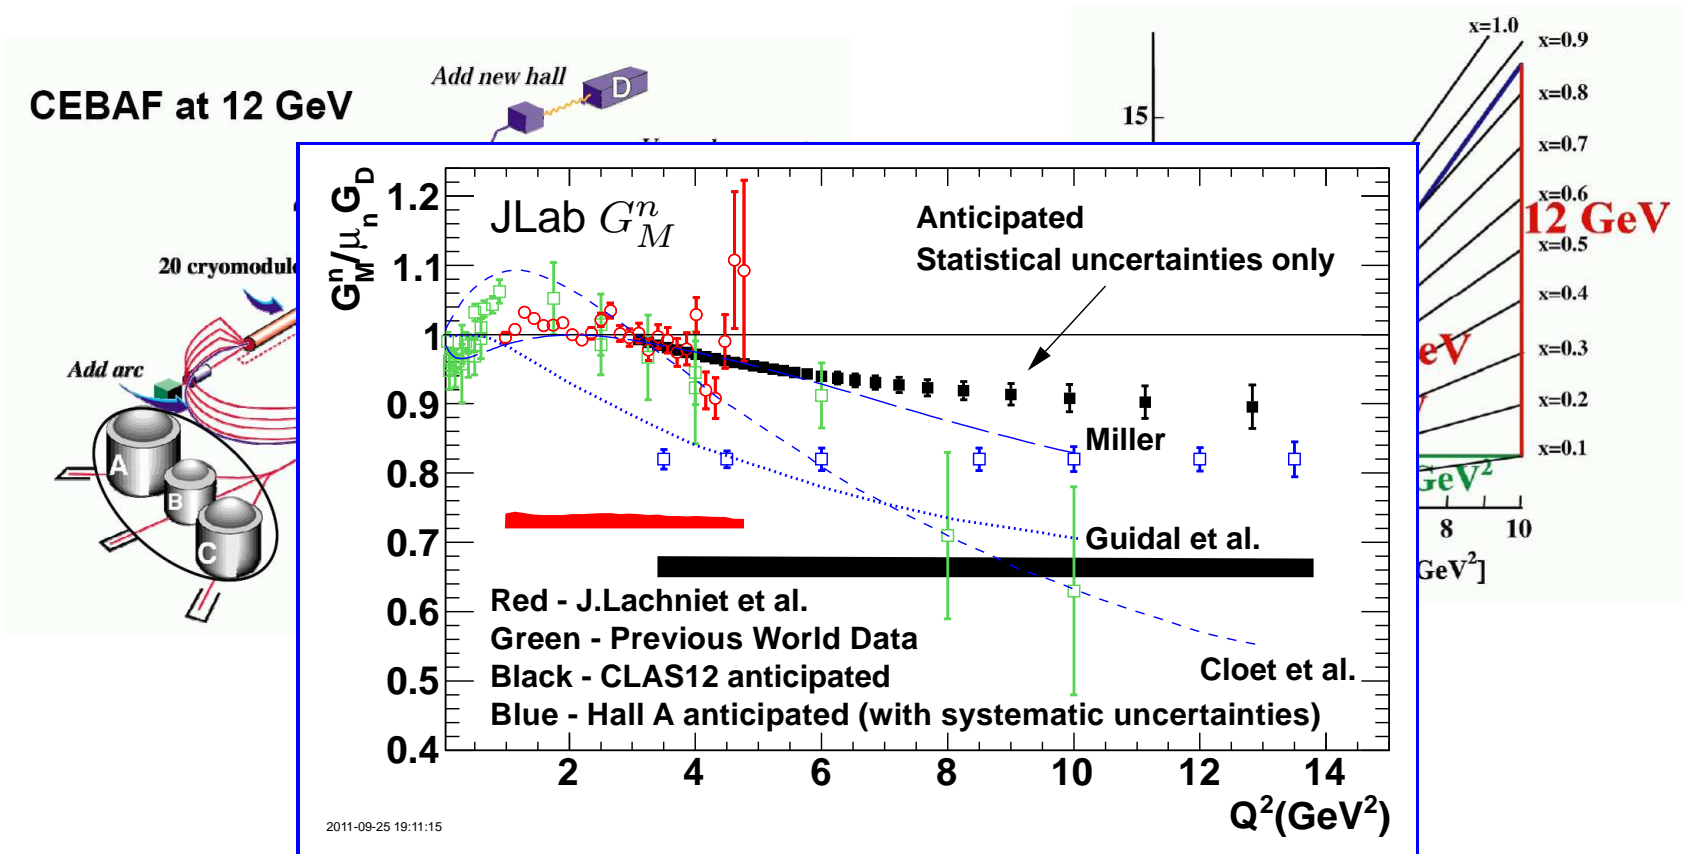

- The electron beam energy at JLab (CEBAF) will be doubled from 6 GeV to 12 GeV.
- Halls A, B and C will be upgraded to accommodate the new physics opportunities.
- A new hall (Hall D) will house a large-acceptance detector built around a solenoidal magnet for photon beam experiments.

# JLab 12-GeV Upgrade

- The electron beam energy at JLab (CEBAF) will be doubled from 6 GeV to 12 GeV.

- A new hall (Hall D) will house a large-acceptance detector built around a solenoidal magnet for photon beam experiments.

# Life on the Frontiers of Knowledge

# Life on the Frontiers of Knowledge

# Concluding Remark

---

- JLab is a laboratory to test and expand our understanding of quark and nuclear matter, QCD, and the Standard Model.
- We continue the quest to unravel the nature of matter at greater and greater depths.
- Lots of new and exciting results are coming out.
- A bright future lies ahead with the JLab 12-GeV Upgrade.
