The Noonday Demon: An Atlas of Depression

Andrew Solomon
Depression

Depression is the flaw in love. To be creatures who love, we must be creatures who can despair at what we lose, and depression is the mechanism of that despair. When it comes, it degrades one's self and ultimately eclipses the capacity to give or receive affection. It is the aloneness within us made manifest, and it destroys not only connection to others but also the ability to be peacefully alone with oneself. Love, though it is no prophylactic against depression, is what cushions the mind and protects it from itself. Medications and psychotherapy can renew that protection, making it easier to love and be loved, and that is why they work. In good spirits, some love themselves and some love others and some love work and some love God: any of these passions can furnish that vital sense of purpose that is the opposite of depression. Love forsakes us from time to time, and we forsake love. In depression, the meaninglessness of every enterprise and every emotion, the meaninglessness of life itself, becomes self-evident. The only feeling left in this loveless state is insignificance.

Life is fraught with sorrows: no matter what we do, we will in the end die; we are, each of us, held in the solitude of an autonomous body; time passes, and what has been will never be again. Pain is the first experience of world-helplessness, and it never leaves us. We are angry about being ripped from the comfortable womb, and as soon as that anger fades, distress comes to take its place. Even those people whose faith promises them that this will all be different in the next world cannot help experiencing
The Noonday Demon

anguish in this one; Christ himself was the man of sorrows. We live, however, in a time of increasing palliatives; it is easier than ever to decide what to feel and what not to feel. There is less and less unpleasantness that is unavoidable in life, for those with the means to avoid. But despite the enthusiastic claims of pharmaceutical science, depression cannot be wiped out so long as we are creatures conscious of our own selves. It can at best be contained—and containing is all that current treatments for depression aim to do.

Highly politicized rhetoric has blurred the distinction between depression and its consequences—the distinction between how you feel and how you act in response. This is in part a social and medical phenomenon, but it is also the result of linguistic vagary attached to emotional vagary. Perhaps depression can best be described as emotional pain that forces itself on us against our will, and then breaks free of its externals. Depression is not just a lot of pain; but too much pain can compost itself into depression. Grief is depression in proportion to circumstance; depression is grief out of proportion to circumstance. It is tumbleweed distress that thrives on thin air, growing despite its detachment from the nourishing earth. It can be described only in metaphor and allegory. Saint Anthony in the desert, asked how he could differentiate between angels who came to him humble and devils who came in rich disguise, said you could tell by how you felt after they had departed. When an angel left you, you felt strengthened by his presence; when a devil left, you felt horror. Grief is a humble angel who leaves you with strong, clear thoughts and a sense of your own depth. Depression is a demon who leaves you appalled.

Depression has been roughly divided into small (mild or disthymic) and large (major) depression. Mild depression is a gradual and sometimes permanent thing that undermines people the way rust weakens iron. It is too much grief at too slight a cause, pain that takes over from the other emotions and crowds them out. Such depression takes up bodily occupancy in the eyelids and in the muscles that keep the spine erect. It hurts your heart and lungs, making the contraction of involuntary muscles harder than it needs to be. Like physical pain that becomes chronic, it is miserable not
so much because it is intolerable in the moment as because it is intolerable to have known it in the moments gone and to look forward only to knowing it in the moments to come. The present tense of mild depression envisages no alleviation because it feels like knowledge.

Virginia Woolf has written about this state with an eerie clarity: "Jacob went to the window and stood with his hands in his pockets. There he saw three Greeks in kilts; the masts of ships; idle or busy people of the lower classes strolling or stepping out briskly, or falling into groups and gesticulating with their hands. Their lack of concern for him was not the cause of his gloom; but some more profound conviction—it was not that he himself happened to be lonely, but that all people are." In the same book, Jacob's Room, she describes how "There rose in her mind a curious sadness, as if time and eternity showed through skirts and waistcoats, and she saw people passing tragically to destruction. Yet, heaven knows, Julia was no fool." It is this acute awareness of transience and limitation that constitutes mild depression. Mild depression, for many years simply accommodated, is increasingly subject to treatment as doctors scrabble to address its diversity.

Large depression is the stuff of breakdowns. If one imagines a soul of iron that weathers with grief and rusts with mild depression, then major depression is the startling collapse of a whole structure. There are two models for depression: the dimensional and the categorical. The dimensional posits that depression sits on a continuum with sadness and represents an extreme version of something everyone has felt and known. The categorical describes depression as an illness totally separate from other emotions, much as a stomach virus is totally different from acid indigestion. Both are true. You go along the gradual path or the sudden trigger of emotion and then you get to a place that is genuinely different. It takes time for a rusting iron-framed building to collapse, but the rust is ceaselessly powdering the solid, thinning it, eviscerating it. The collapse, no matter how abrupt it may feel, is the cumulative consequence of decay. It is nonetheless a highly dramatic and visibly different event. It is a long time from the first rain to the point when rust has eaten through an iron girder.
Sometimes the rusting is at such key points that the collapse seems total, but more often it is partial: this section collapses, knocks that section, shifts the balances in a dramatic way.

It is not pleasant to experience decay, to find yourself exposed to the ravages of an almost daily rain, and to know that you are turning into something feeble, that more and more of you will blow off with the first strong wind, making you less and less. Some people accumulate more emotional rust than others. Depression starts out insipid, fogs the days into a dull color, weakens ordinary actions until their clear shapes are obscured by the effort they require, leaves you tired and bored and self-obsessed—but you can get through all that. Not happily, perhaps, but you can get through. No one has ever been able to define the collapse point that marks major depression, but when you get there, there's not much mistaking it.

Major depression is a birth and a death: it is both the new presence of something and the total disappearance of something. Birth and death are gradual, though official documents may try to pinion natural law by creating categories such as "legally dead" and "time born." Despite nature's vagaries, there is definitely a point at which a baby who has not been in the world is in it, and a point at which a pensioner who has been in the world is no longer in it. It's true that at one stage the baby's head is here and his body not; that until the umbilical cord is severed the child is physically connected to the mother. It's true that the pensioner may close his eyes for the last time some hours before he dies, and that there is a gap between when he stops breathing and when he is declared "brain-dead." Depression exists in time. A patient may say that he has spent certain months suffering major depression, but this is a way of imposing a measurement on the immeasurable. All that one can really say for certain is that one has known major depression, and that one does or does not happen to be experiencing it at any given present moment.

The birth and death that constitute depression occur at once. I returned, not long ago, to a wood in which I had played as a child and saw an oak, a hundred years dignified, in whose shade I used to play with my brother. In twenty years, a huge vine had attached
The Noonday Demon

itself to this confident tree and had nearly smothered it. It was hard
to say where the tree left off and the vine began. The vine had
twisted itself so entirely around the scaffolding of tree branches
that its leaves seemed from a distance to be the leaves of the tree;
only up close could you see how few living oak branches were left,
and how a few desperate little budding sticks of oak stuck like a
row of thumbs up the massive trunk, their leaves continuing to
photosynthesize in the ignorant way of mechanical biology.

Fresh from a major depression in which I had hardly been able to
take on board the idea of other people's problems, I empathized
with that tree. My depression had grown on me as that vine had
conquered the oak; it had been a sucking thing that had wrapped
itself around me, ugly and more alive than I. It had had a life of its
own that bit by bit asphyxiated all of my life out of me. At the
worst stage of major depression, I had moods that I knew were not
my moods: they belonged to the depression, as surely as the leaves
on that tree's high branches belonged to the vine. When I tried to
think clearly about this, I felt that my mind was immured, that it
couldn't expand in any direction. I knew that the sun was rising and
setting, but little of its light reached me. I felt myself sagging under
what was much stronger than I; first I could not use my ankles, and
then I could not control my knees, and then my waist began to
break under the strain, and then my shoulders turned in, and in the
end I was compacted and fetal, depleted by this thing that was
crushing me without holding me. Its tendrils threatened to
pulverize my mind and my courage and my stomach, and crack my
bones and desiccate my body. It went on glutting itself on me
when there seemed nothing left to feed it.

I was not strong enough to stop breathing. I knew then that I
could never kill this vine of depression, and so all I wanted was for
it to let me die. But it had taken from me the energy I would have
needed to kill myself, and it would not kill me. If my trunk was
rotting, this thing that fed on it was now too strong to let it fall; it
had become an alternative support to what it had destroyed. In the
tightest corner of my bed, split and racked by this thing no one else
seemed to be able to see, I prayed to a God I had never entirely
believed in, and I asked for deliverance. I would have been happy

http://www.noondaydemon.com/
to die the most painful death, though I was too dumbly lethargic
even to conceptualize suicide. Every second of being alive hurt me.
Because this thing had drained all fluid from me, I could not even
cry. My mouth was parched as well. I had thought that when you
feel your worst your tears flood, but the very worst pain is the arid
pain of total violation that comes after the tears are all used up, the
pain that stops up every space through which you once metered the
world, or the world, you. This is the presence of major depression.

I have said that depression is both a birth and a death. The vine is
what is born. The death is one's own decay, the cracking of the
branches that support this misery. The first thing that goes is
happiness. You cannot gain pleasure from anything. That's
famously the cardinal symptom of major depression. But soon
other emotions follow happiness into oblivion: sadness as you had
known it, the sadness that seemed to have led you here; your sense
of humor; your belief in and capacity for love. Your mind is
leached until you seem dim-witted even to yourself. If your hair
has always been thin, it seems thinner; if you have always had bad
skin, it gets worse. You smell sour even to yourself. You lose the
ability to trust anyone, to be touched, to grieve. Eventually, you are
simply absent from yourself.

Maybe what is present usurps what becomes absent, and maybe
the absence of obfuscatory things reveals what is present. Either
way, you are less than yourself and in the clutches of something
alien. Too often, treatments address only half the problem: they
focus only on the presence or only on the absence. It is necessary
both to cut away that extra thousand pounds of the vines and to
relearn a root system and the techniques of photosynthesis. Drug
therapy hacks through the vines. You can feel it happening, how
the medication seems to be poisoning the parasite so that bit by bit
it withers away. You feel the weight going, feel the way that the
branches can recover much of their natural bent. Until you have
got rid of the vine, you cannot think about what has been lost. But
even with the vine gone, you may still have few leaves and shallow
roots, and the rebuilding of your self cannot be achieved with any
drugs that now exist. With the weight of the vine gone, little leaves
scattered along the tree skeleton become viable for essential
nourishment. But this is not a good way to be. It is not a strong way to be. Rebuilding of the self in and after depression requires love, insight, work, and, most of all, time.

Diagnosis is as complex as the illness. Patients ask doctors all the time, "Am I depressed?" as though the result were in a definitive blood test. The only way to find out whether you're depressed is to listen to and watch yourself, to feel your feelings and then think about them. If you feel bad without reason most of the time, you're depressed. If you feel bad most of the time with reason, you're also depressed, though changing the reasons may be a better way forward than leaving circumstance alone and attacking the depression. If the depression is disabling to you, then it's major. If it's only mildly distracting, it's not major. Psychiatry's bible—the Diagnostic and Statistical Manual, fourth edition (DSM-IV)—ineptly defines depression as the presence of five or more on a list of nine symptoms. The problem with the definition is that it's entirely arbitrary. There's no particular reason to qualify five symptoms as constituting depression; four symptoms are more or less depression; and five symptoms are less severe than six. Even one symptom is unpleasant. Having slight versions of all the symptoms may be less of a problem than having severe versions of two symptoms. After enduring diagnosis, most people seek causation, despite the fact that knowing why you are sick has no immediate bearing on treating the sickness.

Illness of the mind is real illness. It can have severe effects on the body. People who show up at the offices of their doctors complaining about stomach cramps are frequently told, "Why, there's nothing wrong with you except that you're depressed!" Depression, if it is sufficiently severe to cause stomach cramps, is actually a really bad thing to have wrong with you, and it requires treatment. If you show up complaining that your breathing is troubled, no one says to you, "Why, there's nothing wrong with you except that you have emphysema!" To the person who is experiencing them, psychosomatic complaints are as real as the stomach cramps of someone with food poisoning. They exist in the unconscious brain, and often enough the brain is sending inappropriate messages to the stomach, so they exist there as well.
The diagnosis—whether something is rotten in your stomach or your appendix or your brain—matters in determining treatment and is not trivial. As organs go, the brain is quite an important one, and its malfunctions should be addressed accordingly.

Chemistry is often called on to heal the rift between body and soul. The relief people express when a doctor says their depression is "chemical" is predicated on a belief that there is an integral self that exists across time, and on a fictional divide between the fully occasioned sorrow and the utterly random one. The word chemical seems to assuage the feelings of responsibility people have for the stressed-out discontent of not liking their jobs, worrying about getting old, failing at love, hating their families. There is a pleasant freedom from guilt that has been attached to chemical. If your brain is predisposed to depression, you need not blame yourself for it. Well, blame yourself or evolution, but remember that blame itself can be understood as a chemical process, and that happiness, too, is chemical. Chemistry and biology are not matters that impinge on the "real" self; depression cannot be separated from the person it affects. Treatment does not alleviate a disruption of identity, bringing you back to some kind of normality; it readjusts a multifarious identity, changing in some small degree who you are.

Anyone who has taken high school science classes knows that human beings are made of chemicals and that the study of those chemicals and the structures in which they are configured is called biology. Everything that happens in the brain has chemical manifestations and sources. If you close your eyes and think hard about polar bears, that has a chemical effect on your brain. If you stick to a policy of opposing tax breaks for capital gains, that has a chemical effect on your brain. When you remember some episode from your past, you do so through the complex chemistry of memory. Childhood trauma and subsequent difficulty can alter brain chemistry. Thousands of chemical reactions are involved in deciding to read this book, picking it up with your hands, looking at the shapes of the letters on the page, extracting meaning from those shapes, and having intellectual and emotional responses to what they convey. If time lets you cycle out of a depression and
feel better, the chemical changes are no less particular and complex than the ones that are brought about by taking antidepressants. The external determines the internal as much as the internal invents the external. What is so unattractive is the idea that in addition to all other lines being blurred, the boundaries of what makes us ourselves are blurry. There is no essential self that lies pure as a vein of gold under the chaos of experience and chemistry. Anything can be changed, and we must understand the human organism as a sequence of selves that succumb to or choose one another. And yet the language of science, used in training doctors and, increasingly, in nonacademic writing and conversation, is strangely perverse.

The cumulative results of the brain's chemical effects are not well understood. In the 1989 edition of the standard Comprehensive Textbook of Psychiatry, for example, one finds this helpful formula: a depression score is equivalent to the level of 3-methoxy-4-hydroxyphenylglycol (a compound found in the urine of all people and not apparently affected by depression); minus the level of 3-methoxy-4-hydroxymandelic acid; plus the level of norepinephrine; minus the level of normetanephrine plus the level of metanepherine, the sum of those divided by the level of 3-methoxy-4-hydroxymandelic acid; plus an unspecified conversion variable; or, as CTP puts it: "D-type score = C1 (MHPG) - C2 (VMA) + C3 (NE) - C4 (NMN + MN)/VMA + C0." The score should come out between one for unipolar and zero for bipolar patients, so if you come up with something else—you're doing it wrong. How much insight can such formulae offer? How can they possibly apply to something as nebulous as mood? To what extent specific experience has conduced to a particular depression is hard to determine; nor can we explain through what chemistry a person comes to respond to external circumstance with depression; nor can we work out what makes someone essentially depressive.

Although depression is described by the popular press and the pharmaceutical industry as though it were a single-effect illness such as diabetes, it is not. Indeed, it is strikingly dissimilar to diabetes. Diabetics produce insufficient insulin, and diabetes is treated by increasing and stabilizing insulin in the bloodstream.
Depression is not the consequence of a reduced level of anything we can now measure. Raising levels of serotonin in the brain triggers a process that eventually helps many depressed people to feel better, but that is not because they have abnormally low levels of serotonin. Furthermore, serotonin does not have immediate salutary effects. You could pump a gallon of serotonin into the brain of a depressed person and it would not in the instant make him feel one iota better, though a long-term sustained raise in serotonin level has some effects that ameliorate depressive symptoms. "I'm depressed but it's just chemical" is a sentence equivalent to "I'm murderous but it's just chemical" or "I'm intelligent but it's just chemical." Everything about a person is just chemical if one wants to think in those terms. "You can say it's 'just chemistry,' " says Maggie Robbins, who suffers from manic-depressive illness. "I say there's nothing 'just' about chemistry." The sun shines brightly and that's just chemical too, and it's chemical that rocks are hard, and that the sea is salt, and that certain springtime afternoons carry in their gentle breezes a quality of nostalgia that stirs the heart to longings and imaginings kept dormant by the snows of a long winter. "This serotonin thing," says David McDowell of Columbia University, "is part of modern neuromythology." It's a potent set of stories.

Internal and external reality exist on a continuum. What happens and how you understand it to have happened and how you respond to its happening are usually linked, but no one is predictive of the others. If reality itself is often a relative thing, and the self is in a state of permanent flux, the passage from slight mood to extreme mood is a glissando. Illness, then, is an extreme state of emotion, and one might reasonably describe emotion as a mild form of illness. If we all felt up and great (but not delusionally manic) all the time, we could get more done and might have a happier time on earth, but that idea is creepy and terrifying (though, of course, if we felt up and great all the time we might forget all about creepiness and terror).

Influenza is straightforward: one day you do not have the responsible virus in your system, and another day you do. HIV passes from one person to another in a definable isolated split
Depression? It's like trying to come up with clinical parameters for hunger, which affects us all several times a day, but which in its extreme version is a tragedy that kills its victims. Some people need more food than others; some can function under circumstances of dire malnutrition; some grow weak rapidly and collapse in the streets. Similarly, depression hits different people in different ways: some are predisposed to resist or battle through it, while others are helpless in its grip. Willfulness and pride may allow one person to get through a depression that would fell another whose personality is more gentle and acquiescent.

Depression interacts with personality. Some people are brave in the face of depression (during it and afterward) and some are weak. Since personality too has a random edge and a bewildering chemistry, one can write everything off to genetics, but that is too easy. "There is no such thing as a mood gene," says Steven Hyman, director of the National Institute of Mental Health. "It's just shorthand for very complex gene-environment interactions." If everyone has the capacity for some measure of depression under some circumstances, everyone also has the capacity to fight depression to some degree under some circumstances. Often, the fight takes the form of seeking out the treatments that will be most effective in the battle. It involves finding help while you are still strong enough to do so. It involves making the most of the life you have between your most severe episodes. Some horrendously symptom-ridden people are able to achieve real success in life; and some people are utterly destroyed by the mildest forms of the illness.

Working through a mild depression without medications has certain advantages. It gives you the sense that you can correct your own chemical imbalances through the exercise of your own chemical will. Learning to walk across hot coals is also a triumph of the brain over what appears to be the inevitable physical chemistry of pain, and it is a thrilling way to discover the sheer power of mind. Getting through a depression "on your own" allows you to avoid the social discomfort associated with psychiatric medications. It suggests that we are accepting ourselves as we were made, reconstructing ourselves only with our own interior
mechanics and without help from the outside. Returning from distress by gradual degrees gives sense to affliction itself.

Interior mechanics, however, are difficult to commission and are frequently inadequate. Depression frequently destroys the power of mind over mood. Sometimes the complex chemistry of sorrow kicks in because you've lost someone you love, and the chemistry of loss and love may lead to the chemistry of depression. The chemistry of falling in love can kick in for obvious external reasons, or along lines that the heart can never tell the mind. If we wanted to treat this madness of emotion, we could perhaps do so. It is mad for adolescents to rage at parents who have done their best, but it is a conventional madness, uniform enough so that we tolerate it relatively unquestioningly. Sometimes the same chemistry kicks in for external reasons that are not sufficient, by mainstream standards, to explain the despair: someone bumps into you in a crowded bus and you want to cry, or you read about world overpopulation and find your own life intolerable. Everyone has on occasion felt disproportionate emotion over a small matter or has felt emotions whose origin is obscure or that may have no origin at all. Sometimes the chemistry kicks in for no apparent external reason at all. Most people have had moments of inexplicable despair, often in the middle of the night or in the early morning before the alarm clock sounds. If such feelings last ten minutes, they're a strange, quick mood. If they last ten hours, they're a disturbing febrility, and if they last ten years, they're a crippling illness.

It is too often the quality of happiness that you feel at every moment its fragility, while depression seems when you are in it to be a state that will never pass. Even if you accept that moods change, that whatever you feel today will be different tomorrow, you cannot relax into happiness as you can into sadness. For me, sadness always has been and still is a more powerful feeling; and if that is not a universal experience, perhaps it is the base from which depression grows. I hated being depressed, but it was also in depression that I learned my own acreage, the full extent of my soul. When I am happy, I feel slightly distracted by happiness, as though it fails to use some part of my mind and brain that wants
The Noonday Demon

the exercise. Depression is something to do. My grasp tightens and becomes acute in moments of loss: I can see the beauty of glass objects fully at the moment when they slip from my hand toward the floor. "We find pleasure much less pleasurable, pain much more painful than we had anticipated," Schopenhauer wrote. "We require at all times a certain quantity of care or sorrow or want, as a ship requires ballast, to keep on a straight course."

There is a Russian expression: if you wake up feeling no pain, you know you're dead. While life is not only about pain, the experience of pain, which is particular in its intensity, is one of the surest signs of the life force. Schopenhauer said, "Imagine this race transported to a Utopia where everything grows of its own accord and turkeys fly around ready-roasted, where lovers find one another without any delay and keep one another without any difficulty: in such a place some men would die of boredom or hang themselves, some would fight and kill one another, and thus they would create for themselves more suffering than nature inflicts on them as it is...the polar opposite of suffering [is] boredom." I believe that pain needs to be transformed but not forgotten; gainsaid but not obliterated.

I am persuaded that some of the broadest figures for depression are based in reality. Though it is a mistake to confuse numbers with truth, these figures tell an alarming story. According to recent research, about 3 percent of Americans—some 19 million—suffer from chronic depression. More than 2 million of those are children. Manic-depressive illness, often called bipolar illness because the mood of its victims varies from mania to depression, afflicts about 2.3 million and is the second-leading killer of young women, the third of young men. Depression as described in DSM-IV is the leading cause of disability in the United States and abroad for persons over the age of five. Worldwide, including the developing world, depression accounts for more of the disease burden, as calculated by premature death plus healthy life-years lost to disability, than anything else but heart disease. Depression claims more years than war, cancer, and AIDS put together. Other illnesses, from alcoholism to heart disease, mask depression when

http://www.noondaydemon.com/
it causes them; if one takes that into consideration, depression may be the biggest killer on earth.

Treatments for depression are proliferating now, but only half of Americans who have had major depression have ever sought help of any kind—even from a clergyman or a counselor. About 95 percent of that 50 percent go to primary-care physicians, who often don't know much about psychiatric complaints. An American adult with depression would have his illness recognized only about 40 percent of the time. Nonetheless, about 28 million Americans—one in every ten—are now on SSRIs (selective serotonin reuptake inhibitors—the class of drugs to which Prozac belongs), and a substantial number are on other medications. Less than half of those whose illness is recognized will get appropriate treatment. As definitions of depression have broadened to include more and more of the general population, it has become increasingly difficult to calculate an exact mortality figure. The statistic traditionally given is that 15 percent of depressed people will eventually commit suicide; this figure still holds for those with extreme illness. Recent studies that include milder depression show that 2 to 4 percent of depressives will die by their own hand as a direct consequence of the illness. This is still a staggering figure. Twenty years ago, about 1.5 percent of the population had depression that required treatment; now it's 5 percent; and as many as 10 percent of all Americans now living can expect to have a major depressive episode during their life. About 50 percent will experience some symptoms of depression. Clinical problems have increased; treatments have increased vastly more. Diagnosis is on the up, but that does not explain the scale of this problem. Incidents of depression are increasing across the developed world, particularly in children. Depression is occurring in younger people, making its first appearance when its victims are about twenty-six, ten years younger than a generation ago; bipolar disorder, or manic-depressive illness, sets in even earlier. Things are getting worse.

There are few conditions at once as undertreated and as overtreated as depression. People who become totally dysfunctional are ultimately hospitalized and are likely to receive treatment, though sometimes their depression is confused with the
physical ailments through which it is experienced. A world of people, however, are just barely holding on and continue, despite the great revolutions in psychiatric and psychopharmaceutical treatments, to suffer abject misery. More than half of those who do seek help—another 25 percent of the depressed population—receive no treatment. About half of those who do receive treatment—13 percent or so of the depressed population—receive unsuitable treatment, often tranquilizers or immaterial psychotherapies. Of those who are left, half—some 6 percent of the depressed population—receive inadequate dosage for an inadequate length of time. So that leaves about 6 percent of the total depressed population who are getting adequate treatment. But many of these ultimately go off their medications, usually because of side effects. "It's between 1 and 2 percent who get really optimal treatment," says John Greden, director of the Mental Health Research Institute at the University of Michigan, "for an illness that can usually be well-controlled with relatively inexpensive medications that have few serious side effects." Meanwhile, at the other end of the spectrum, people who suppose that bliss is their birthright pop cavalcades of pills in a futile bid to alleviate those mild discomforts that texture every life.

It has been fairly well established that the advent of the supermodel has damaged women's images of themselves by setting unrealistic expectations. The psychological supermodel of the twenty-first century is even more dangerous than the physical one. People are constantly examining their own minds and rejecting their own moods. "It's the Lourdes phenomenon," says William Potter, who ran the psychopharmacological division of the National Institute of Mental Health (NIMH) through the seventies and eighties, when the new drugs were being developed. "When you expose very large numbers of people to what they perceive and have reason to believe is positive, you get reports of miracles—and also, of course, of tragedy." Prozac is so easily tolerated that almost anyone can take it, and almost anyone does. It's been used on people with slight complaints who would not have been game for the discomforts of the older antidepressants, the monoamine oxidase inhibitors (MAOIs) or tricyclics. Even if
you're not depressed, it might push back the edges of your sadness, and wouldn't that be nicer than living with pain?

We pathologize the curable, and what can easily be modified comes to be treated as illness, even if it was previously treated as personality or mood. As soon as we have a drug for violence, violence will be an illness. There are many grey states between full-blown depression and a mild ache unaccompanied by changes of sleep, appetite, energy, or interest; we have begun to class more and more of these as illness because we have found more and more ways to ameliorate them. But the cutoff point remains arbitrary. We have decided that an IQ of 69 constitutes retardation, but someone with an IQ of 72 is not in great shape, and someone with an IQ of 65 can still kind of manage; we have said that cholesterol should be kept under 220, but if your cholesterol is 221, you probably won't die from it, and if it's 219, you need to be careful: 69 and 220 are arbitrary numbers, and what we call illness is also really quite arbitrary; in the case of depression, it is also in perpetual flux.

Depressives use the phrase "over the edge" all the time to delineate the passage from pain to madness. This very physical description frequently entails falling "into the abyss." It's odd that so many people have such a consistent vocabulary, because the edge is really quite an abstracted metaphor. Few of us have ever fallen off the edge of anything, and certainly not into an abyss. The Grand Canyon? A Norwegian fjord? A South African diamond mine? It's difficult even to find an abyss to fall into. When asked, people describe the abyss pretty consistently. In the first place, it's dark. You are falling away from the sunlight toward a place where the shadows are black. Inside it, you cannot see, and the dangers are everywhere (it's neither soft-bottomed nor soft-sided, the abyss). While you are falling, you don't know how deep you can go, or whether you can in any way stop yourself. You hit invisible things over and over again until you are shredded, and yet your environment is too unstable for you to catch onto anything.

Fear of heights is the most common phobia in the world and must have served our ancestors well, since the ones who were not afraid probably found abysses and fell into them, so knocking their
The Noonday Demon

genetic material out of the race. If you stand on the edge of a cliff and look down, you feel dizzy. Your body does not work better than ever and allow you to move with immaculate precision back from the edge. You think you're going to fall, and if you look for long, you will fall. You're paralyzed. I remember going with friends to Victoria Falls, where great heights of rock drop down sheer to the Zambezi River. We were young and were sort of challenging one another by posing for photos as close to the edge as we dared to go. Each of us, upon going too close to the edge, felt sick and paralytic. I think depression is not usually going over the edge itself (which soon makes you die), but drawing too close to the edge, getting to that moment of fear when you have gone so far, when dizziness has deprived you so entirely of your capacity for balance. By Victoria Falls, we discovered that the unpassable thing was an invisible edge that lay well short of the place where the stone dropped away. Ten feet from the sheer drop, we all felt fine. Five feet from it, most of us quailed. At one point, a friend was taking a picture of me and wanted to get the bridge to Zambia into the shot. "Can you move an inch to the left?" she asked, and I obligingly took a step to the left—a foot to the left. I smiled, a nice smile that's preserved there in the photo, and she said, "You're getting a little bit close to the edge. C'mon back." I had been perfectly comfortable standing there, and then I suddenly looked down and saw that I had passed my edge. The blood drained from my face. "You're fine," my friend said, and walked nearer to me and held out her hand. The sheer cliff was ten inches away and yet I had to drop to my knees and lay myself flat along the ground to pull myself a few feet until I was on safe ground again. I know that I have an adequate sense of balance and that I can quite easily stand on an eighteen-inch-wide platform; I can even do a bit of amateur tap dancing, and I can do it reliably without falling over. I could not stand so close to the Zambezi.

Depression relies heavily on a paralyzing sense of imminence. What you can do at an elevation of six inches you cannot do when the ground drops away to reveal a drop of a thousand feet. Terror of the fall grips you even if that terror is what might make you fall. What is happening to you in depression is horrible, but it seems to
be very much wrapped up in what is about to happen to you. Among other things, you feel you are about to die. The dying would not be so bad, but the living at the brink of dying, the not-quite-over-the-geographical-edge condition, is horrible. In a major depression, the hands that reach out to you are just out of reach. You cannot make it down onto your hands and knees because you feel that as soon as you lean, even away from the edge, you will lose your balance and plunge down. Oh, some of the abyss imagery fits: the darkness, the uncertainty, the loss of control. But if you were actually falling endlessly down an abyss, there would be no question of control. You would be out of control entirely. Here there is that horrifying sense that control has left you just when you most need it and by rights should have it. A terrible imminence overtakes entirely the present moment. Depression has gone too far when, despite a wide margin of safety, you cannot balance anymore. In depression, all that is happening in the present is the anticipation of pain in the future, and the present qua present no longer exists at all.

Depression is a condition that is almost unimaginable to anyone who has not known it. A sequence of metaphors—vines, trees, cliffs, etc.—is the only way to talk about the experience. It's not an easy diagnosis because it depends on metaphors, and the metaphors one patient chooses are different from those selected by another patient. Not so much has changed since Antonio in *The Merchant of Venice* complained:

> It wearies me, you say it wearies you;  
> But how I caught it, found it, or came by it  
> What stuff 'tis made of, whereof it is born  
> I am to learn;  
> And such a want-wit sadness makes of me,  
> That I have much ado to know myself.

Let us make no bones about it: We do not really know what causes depression. We do not really know what constitutes depression. We do not really know why certain treatments may be effective for depression. We do not know how depression made it through the evolutionary process. We do not know why one person
gets a depression from circumstances that do not trouble another. We do not know how will operates in this context.

People around depressives expect them to get themselves together: our society has little room in it for moping. Spouses, parents, children, and friends are all subject to being brought down themselves, and they do not want to be close to measureless pain. No one can do anything but beg for help (if he can do even that) at the lowest depths of a major depression, but once the help is provided, it must also be accepted. We would all like Prozac to do it for us, but in my experience, Prozac doesn't do it unless we help it along. Listen to the people who love you. Believe that they are worth living for even when you don't believe it. Seek out the memories depression takes away and project them into the future. Be brave; be strong; take your pills. Exercise because it's good for you even if every step weighs a thousand pounds. Eat when food itself disgusts you. Reason with yourself when you have lost your reason. These fortune-cookie admonitions sound pat, but the surest way out of depression is to dislike it and not to let yourself grow accustomed to it. Block out the terrible thoughts that invade your mind.

I will be in treatment for depression for a long time. I wish I could say how it happened. I have no idea how I fell so low, and little sense of how I bounced up or fell again, and again, and again. I treated the presence, the vine, in every conventional way I could find, then figured out how to repair the absence as laboriously yet intuitively as I learned to walk or talk. I had many slight lapses, then two serious breakdowns, then a rest, then a third breakdown, and then a few more lapses. After all that, I do what I have to do to avoid further disturbances. Every morning and every night, I look at the pills in my hand: white, pink, red, turquoise. Sometimes they seem like writing in my hand, hieroglyphics saying that the future may be all right and that I owe it to myself to live on and see. I feel sometimes as though I am swallowing my own funeral twice a day, since without these pills, I'd be long gone. I go to see my therapist once a week when I'm at home. I am sometimes bored by our sessions and sometimes interested in an entirely dissociative way and sometimes have a feeling of epiphany. In part, from the things
this man said, I rebuilt myself enough to be able to keep swallowing my funeral instead of enacting it. A lot of talking was involved: I believe that words are strong, that they can overwhelm what we fear when fear seems more awful than life is good. I have turned, with an increasingly fine attention, to love. Love is the other way forward. They need to go together: by themselves pills are a weak poison, love a blunt knife, insight a rope that snaps under too much strain. With the lot of them, if you are lucky, you can save the tree from the vine.

I love this century. I would love to have the capacity for time travel because I would love to visit biblical Egypt, Renaissance Italy, Elizabethan England, to see the heyday of the Inca, to meet the inhabitants of Great Zimbabwe, to see what America was like when the indigenous peoples held the land. But there is no other time in which I would prefer to live. I love the comforts of modern life. I love the complexity of our philosophy. I love the sense of vast transformation that hangs on us at this new millennium, the feeling that we are at the brink of knowing more than people have ever known before. I like the relatively high level of social tolerance that exists in the countries where I live. I like being able to travel around the world over and over and over again. I like that people live longer than they have ever lived before, that time is a little more on our side than it was a thousand years ago.

We are, however, facing an unparalleled crisis in our physical environment. We are consuming the production of the earth at a frightening pace, sabotaging the land, sea, and sky. The rain forest is being destroyed; our oceans brim with industrial waste; the ozone layer is depleted. There are far more people in the world than there have ever been before, and next year there will be even more, and the year after that there will be many more again. We are creating problems that will trouble the next generation, and the next, and the next after that. Man has been changing the earth ever since the first flint knife was shaped from a stone and the first seed was sowed by an Anatolian farmer, but the pace of alteration is now getting severely out of hand. I am not an environmental alarmist. I do not believe that we are at the brink of apocalypse
right now. But I am convinced that we must take steps to alter our current course if we are not to pilot ourselves into oblivion.

It is an indication of the resilience of humankind that we unearth new solutions to those problems. The world goes on and so does the species. Skin cancer is far more prevalent than it used to be because the atmosphere provides us far less protection from the sun. Summers, I wear lotions and creams with high SPF levels, and they help to keep me safe. I have from time to time gone to a dermatologist, who has snipped off an outsize freckle and sent it off to a lab to be checked. Children who once ran along the beach naked are now slathered in protective ointments. Men who once worked shirtless at noon now wear shirts and try to find the shade. We have the ability to cope with this aspect of this crisis. We invent new ways, which are well short of living in the dark. Sunblock or no sunblock, however, we must try not to destroy what's left. Right now, there's still a lot of ozone out there and it's still doing its job moderately well. It would be better for the environment if everyone stopped using cars, but that's not going to happen unless there's a tidal wave of utter crisis. Frankly, I think there will be men living on the moon before there will be a society free of automotive transport. Radical change is impossible and in many ways undesirable, but change is certainly required.

It appears that depression has been around as long as man has been capable of self-conscious thought. It may be that depression existed even before that time, that monkeys and rats and perhaps octopi were suffering the disease before those first humanoids found their way into their caves. Certainly the symptomatology of our time is more or less indistinguishable from what was described by Hippocrates some twenty-five hundred years ago. Neither depression nor skin cancer is a creation of the twenty-first century. Like skin cancer, depression is a bodily affliction that has escalated in recent times for fairly specific reasons. Let us not stand too long ignoring the clear message of burgeoning problems. Vulnerabilities that in a previous era would have remained undetectable now blossom into full-blown clinical illness. We must not only avail ourselves of the immediate solutions to our current problems, but also seek to contain those problems and to avoid their purloining
all our minds. The climbing rates of depression are without question the consequence of modernity. The pace of life, the technological chaos of it, the alienation of people from one another, the breakdown of traditional family structures, the loneliness that is endemic, the failure of systems of belief (religious, moral, political, social—anything that seemed once to give meaning and direction to life) have been catastrophic. Fortunately, we have developed systems for coping with the problem. We have medications that address the organic disturbances, and therapies that address the emotional upheavals of chronic disease. Depression is an increasing cost for our society, but it is not ruinous. We have the psychological equivalents of sunscreens and baseball hats and shade.

But do we have the equivalent of an environmental movement, a system to contain the damage we are doing to the social ozone layer? That there are treatments should not cause us to ignore the problem that is treated. We need to be terrified by the statistics. What is to be done? Sometimes it seems that the rate of illness and the number of cures are in a sort of competition to see which can outstrip the other. Few of us want to, or can, give up modernity of thought any more than we want to give up modernity of material existence. But we must start doing small things now to lower the level of socio-emotional pollution. We must look for faith (in anything: God or the self or other people or politics or beauty or just about anything else) and structure. We must help the disenfranchised whose suffering undermines so much of the world's joy—for the sake both of those huddled masses and of the privileged people who lack profound motivation in their own lives. We must practice the business of love, and we must teach it too. We must ameliorate the circumstances that conduce to our terrifyingly high levels of stress. We must hold out against violence, and perhaps against its representations. This is not a sentimental proposal; it is as urgent as the cry to save the rain forest.

At some point, a point we have not quite reached but will, I think, reach soon, the level of damage will begin to be more terrible than the advances we buy with that damage. There will be
The Noonday Demon

no revolution, but there will be the advent, perhaps, of different kinds of schools, different models of family and community, different processes of information. If we are to continue on earth, we will have to do so. We will balance treating illness with changing the circumstances that cause it. We will look to prevention as much as to cure. In the maturity of the new millennium, we will, I hope, save this earth's rain forests, the ozone layer, the rivers and streams, the oceans; and we will also save, I hope, the minds and hearts of the people who live here. Then we will curb our escalating fear of the demons of the noon—our anxiety and depression.

The people of Cambodia live in the compass of immemorial tragedy. During the 1970s, the revolutionary Pol Pot established a Maoist dictatorship in Cambodia in the name of what he called the Khmer Rouge. Years of bloody civil war followed, during which more than 20 percent of the population was slaughtered. The educated elite was obliterated, and the peasantry was regularly moved from one location to another, some of them taken into prison cells where they were mocked and tortured; the entire country lived in perpetual fear. It is hard to rank wars—recent atrocities in Rwanda have been particularly ravaging—but certainly the Pol Pot period was as awful as any time anywhere in recent history. What happens to your emotions when you have seen a quarter of your compatriots murdered, when you have lived yourself in the hardship of a brutal regime, when you are fighting against the odds to rebuild a devastated nation? I hoped to see what happens to feeling among the citizens of a nation when they have all endured such traumatic stress, are desperately poor, have virtually no resources, and have little chance for education or employment. I might have chosen other locations to find suffering, but I did not want to go into a country at war, since the despair psychology of wartime is usually frenzied, while the despair that follows devastation is more numb and all-encompassing. Cambodia is not a country in which faction fought brutally against faction; it is a country in which everyone was at war with everyone else, in which all the mechanisms of society were completely
The Noonday Demon

annihilated, in which there was no love left, no idealism, nothing good for anyone.

The Cambodians are in general affable, and they are friendly as can be to foreigners who visit them. Most of them are soft-spoken, gentle, and attractive. It's hard to believe that this lovely country is the one in which Pol Pot's atrocities took place. Everyone I met had a different explanation for how the Khmer Rouge could have happened there, but none of these explanations made sense, just as none of the explanations for the Cultural Revolution or for Stalinism or for Nazism makes sense. These things happen to societies, and in retrospect it is possible to understand why a nation was especially vulnerable to them; but where in the human imagination such behaviors originate is unknowable. The social fabric is always very thin, but it is impossible to know how it gets vaporized entirely as it did in these societies. The American ambassador there told me that the greatest problem for the Khmer people is that traditional Cambodian society has no peaceful mechanism to resolve conflict. "If they have differences," he said, "they have to deny them and suppress them totally, or they have to take out knives and fight." A Cambodian member of the current government said that the people had been too subservient to an absolute monarch for too many years and didn't think to fight against authority until it was too late. I heard at least a dozen other stories; I remain skeptical.

During interviews with people who had suffered atrocities at the hands of the Khmer Rouge, I found that most preferred to look forward. When I pressed them on personal history, however, they would slip into the mournful past tense. The stories I heard were inhuman and terrifying and repulsive. Every adult I met in Cambodia had suffered such external traumas as would have driven most of us to madness or suicide. What they had suffered within their own minds was at yet another level of horror. I went to Cambodia to be humbled by the pain of others, and I was humbled down to the ground.

Five days before I left the country, I met with Phaly Nuon, a sometime candidate for the Nobel Peace Prize, who has set up an orphanage and a center for depressed women in Phnom Penh. She
The Noonday Demon

has achieved astonishing success in resuscitating women whose mental afflictions are such that other doctors have left them for dead. Indeed her success has been so enormous that her orphanage is almost entirely staffed by the women she has helped, who have formed a community of generosity around Phaly Nuon. If you save the women, it has been said, they will in turn save the children, and so by tracing a chain of influence one can save the country.

We met in a small room in an old office building near the center of Phnom Penh. She sat on a chair on one side, and I sat on a small sofa opposite. Phaly Nuon's asymmetrical eyes seem to see through you at once and, nonetheless, to welcome you in. Like most Cambodians, she is relatively diminutive by Western standards. Her hair, streaked grey, was pulled back from her face and gave it a certain hardness of emphasis. She can be aggressive in making a point, but she is also shy, smiling and looking down whenever she is not speaking.

We started with her own story. In the early seventies, Phaly Nuon worked for the Cambodian Department of the Treasury and Chamber of Commerce as a typist and shorthand secretary. In 1975, when Phnom Penh fell to Pol Pot and the Khmer Rouge, she was taken from her house with her husband and her children. Her husband was sent off to a location unknown to her, and she had no idea whether he was executed or remained alive. She was put to work in the countryside as a field laborer with her twelve-year-old daughter, her three-year-old son, and her newborn baby. The conditions were terrible and food was scarce, but she worked beside her fellows, "never telling them anything, and never smiling, as none of us ever smiled, because we knew that at any moment we could be put to death." After a few months, she and her family were packed off to another location. During the transfer, a group of soldiers tied her to a tree and made her watch while her daughter was gang-raped and then murdered. A few days later it was Phaly Nuon's turn. She was brought with some fellow laborers to a field outside of town. Then they tied her hands behind her back and roped her legs together. After forcing her to her knees, they tied her to a rod of bamboo, and they made her lean forward over a mucky field, so that her legs had to be tensed or she would
lose her balance. The idea was that when she finally dropped of exhaustion, she would fall forward into the mud and, unable to move, would drown in it. Her three-year-old son bellowed and cried beside her. The infant was tied to her so that he would drown in the mud when she fell: Phaly Nuon would be the murderer of her own baby.

Phaly Nuon told a lie. She said that she had, before the war, worked for one of the high-level members of the Khmer Rouge, that she had been his lover, that he would be angry if she were killed. Few people escaped the killing fields, but a captain who perhaps believed Phaly Nuon's story eventually said that he couldn't bear the sound of her children screaming and that bullets were too expensive to waste on killing her quickly, and he untied Phaly Nuon and told her to run. Her baby in one arm and the three-year-old in the other, she bolted deep into the jungle of northeastern Cambodia. She stayed in the jungle for three years, four months, and eighteen days. She never slept twice in the same place. As she wandered, she picked leaves and dug for roots to feed herself and her family, but food was hard to find and other, stronger foragers had often stripped the land bare. Severely malnourished, she began to waste away. Her breast milk soon ran dry, and the baby she could not feed died in her arms. She and her remaining child just barely held on to life and managed to get through the period of war.

By the time Phaly Nuon told me this, we had both moved to the floor between our seats, and she was weeping and rocking back and forth on the balls of her feet, while I sat with my knees under my chin and a hand on her shoulder in as much of an embrace as her trancelike state during her narrative would allow. She went on in a half-whisper. After the war was over, she found her husband. He had been severely beaten around the head and neck, resulting in significant mental deficit. She and her husband and her son were all placed in a border camp near Thailand, where thousands of people lived in temporary tented structures. They were physically and sexually abused by some of the workers at the camp, and helped by others. Phaly Nuon was one of the only educated people there, and, knowing languages, she could talk to the aid workers.
She became an important part of the life of the camp, and she and her family were given a wooden hut that passed for comparative luxury. "I helped with certain aid tasks at that time," she recalls. "All the time while I went around, I saw women who were in very bad shape, many of them seeming paralyzed, not moving, not talking, not feeding or caring for their own children. I saw that though they had survived the war, they were now going to die from their depression, their utterly incapacitating post-traumatic stress." Phaly Nuon made a special request to the aid workers and set up her hut in the camp as a sort of psychotherapy center.

She used traditional Khmer medicine (made with varied proportions of more than a hundred herbs and leaves) as a first step. If that did not work or did not work sufficiently well, she would use occidental medicine if it was available, as it sometimes was. "I would hide away stashes of whatever antidepressants the aid workers could bring in," she said, "and try to have enough for the worst cases." She would take her patients to meditate, keeping in her house a Buddhist shrine with flowers in front of it. She would seduce the women into openness. First, she would take about three hours to get each woman to tell her story. Then she would make regular follow-up visits to try to get more of the story, until she finally got the full trust of the depressed woman. "I had to know the stories these women had to tell," she explained, "because I wanted to understand very specifically what each one had to vanquish."

Once this initiation was concluded, she would move on to a formulaic system. "I take it in three steps," she said. "First, I teach them to forget. We have exercises we do each day, so that each day they can forget a little more of the things they will never forget entirely. During this time, I try to distract them with music or with embroidery or weaving, with concerts, with an occasional hour of television, with whatever seems to work, whatever they tell me they like. Depression is under the skin, all the surface of the body has the depression just below it, and we cannot take it out; but we can try to forget the depression even though it is right there.

"When their minds are cleared of what they have forgotten, when they have learned forgetfulness well, I teach them to work.
Whatever kind of work they want to do, I will find a way to teach it to them. Some of them train only to clean houses, or to take care of children. Others learn skills they can use with the orphans, and some begin toward a real profession. They must learn to do these things well and to have pride in them.

"And then when they have mastered work, at last, I teach them to love. I built a sort of lean-to and made it a steam bath, and now in Phnom Penh I have a similar one that I use, a little better built. I take them there so that they can become clean, and I teach them how to give one another manicures and pedicures and how to take care of their fingernails, because doing that makes them feel beautiful, and they want so much to feel beautiful. It also puts them in contact with the bodies of other people and makes them give up their bodies to the care of others. It rescues them from physical isolation, which is a usual affliction for them, and that leads to the breakdown of the emotional isolation. While they are together washing and putting on nail polish, they begin to talk together, and bit by bit they learn to trust one another, and by the end of it all, they have learned how to make friends, so that they will never have to be so lonely and so alone again. Their stories, which they have told to no one but me—they begin to tell those stories to one another."

Phaly Nuon later showed me the tools of her psychologist's trade, the little bottles of colored enamel, the steam room, the sticks for pushing back cuticles, the emery boards, the towels. Grooming is one of the primary forms of socialization among primates, and this return to grooming as a socializing force among human beings struck me as curiously organic. I told her that I thought it was difficult to teach ourselves or others how to forget, how to work, and how to love and be loved, but she said it was not so complicated if you could do those three things yourself. She told me about how the women she has treated have become a community, and about how well they do with the orphans of whom they take care.

"There is a final step," she said to me after a long pause. "At the end, I teach them the most important thing. I teach them that these three skills—forgetting, working, and loving—are not three
separate skills, but part of one enormous whole, and that it is the practice of these things together, each as part of the others, that makes a difference. It is the hardest thing to convey"—she laughed—"but they all come to understand this, and when they do—why, then they are ready to go into the world again."

Depression now exists as a personal and as a social phenomenon. To treat depression, one must understand the experience of a breakdown, the mode of action of medication, and the most common forms of talking therapy (psychoanalytic, interpersonal, and cognitive). Experience is a good teacher and the mainstream treatments have been tried and tested; but many other treatments, from Saint-John’s-wort to psychosurgery, hold out reasonable promise—though there is also more quackery here than in any other area of medicine. Intelligent treatment requires a close examination of specific populations: depression has noteworthy variants particular to children, to the elderly, and to each gender. Substance abusers form a large subcategory of their own. Suicide, in its many forms, is a complication of depression; it is critical to understand how a depression can become fatal.

These experiential matters lead to the epidemiological. It is fashionable to look at depression as a modern complaint, and this is a gross error, which a review of psychiatric history serves to clarify. It is also fashionable to think of the complaint as somehow middle-class and fairly consistent in its manifestations. This is not true. Looking at depression among the poor, we can see that taboos and prejudices are blocking us from helping a population that is singularly receptive to that help. The problem of depression among the poor leads naturally into specific politics. We legislate ideas of illness and treatment in and out of existence.

Biology is not destiny. There are ways to lead a good life with depression. Indeed, people who learn from their depression can develop a particular moral profundity from the experience, and this is the thing with feathers at the bottom of their box of miseries. There is a basic emotional spectrum from which we cannot and should not escape, and I believe that depression is in that spectrum, located near not only grief but also love. Indeed I believe that all the strong emotions stand together, and that every one of them is
contingent on what we commonly think of as its opposite. I have for the moment managed to contain the disablement that depression causes, but the depression itself lives forever in the cipher of my brain. It is part of me. To wage war on depression is to fight against oneself, and it is important to know that in advance of the battles. I believe that depression can be eliminated only by undermining the emotional mechanisms that make us human. Science and philosophy must proceed by half-measures.

"Welcome this pain," Ovid once wrote, "for you will learn from it." It is possible (though for the time being unlikely) that, through chemical manipulation, we might locate, control, and eliminate the brain's circuitry of suffering. I hope we will never do it. To take it away would be to flatten out experience, to impinge on a complexity more valuable than any of its component parts are agonizing. If I could see the world in nine dimensions, I'd pay a high price to do it. I would live forever in the haze of sorrow rather than give up the capacity for pain. But pain is not acute depression; one loves and is loved in great pain, and one is alive in the experience of it. It is the walking-death quality of depression that I have tried to eliminate from my life; it is as artillery against that extinction that this book is written.
