

The Limits of Sight

1

The WorldView-4 satellite is a commercial satellite designed to take surveillance photographs for sale and has been active since 2014. The cost for photos from the satellite archive is as low \$14. The aperture of the camera on the satellite is $a = 1.1 \text{ m}$ and the satellite operates $L = 620 \text{ km}$ above the Earth. What is the size of the smallest object visible to the camera? Visible light covers a range of wavelengths of $\lambda \approx 400 - 700 \text{ nm}$. What is the size of the smallest object visible to human eyes?

The intensity of sunlight reaching the Earth is called the solar constant (which is not really constant) and has a value of $I_s = 1366 \text{ J/s} - \text{m}^2$. What is the size of the electric field in sunlight? How does this compare with the typical fields we use in lab ($|\vec{E}| \approx 10 \text{ N/C}$)?

The videos are [here](#) and [here](#). The simulation is [here](#).

Double Slit Interference

Double Slit Interference

A double-slit experiment is performed with $\lambda = 589 \text{ nm}$ light and a distance $L = 2.0 \text{ m}$ between the slits and the screen. The fifth interference maximum is observed at a distance $y = 4.0 \text{ mm}$ from the central maximum. What is the spacing d of the slits?

The aperture of the camera on the satellite is $a = 1.1 \text{ m}$ and the satellite operates $L = 620 \text{ km}$ above the Earth. What is the size of the smallest object visible to the camera? Visible light covers a range of wavelengths of $\lambda \approx 400 - 700 \text{ nm}$. What is the size of the smallest object visible to human eyes?

A laser beam is passed through two narrow slits and an interference pattern is thrown on a screen a distance $L = 1.7 \text{ m}$ away from the slits. The bright spots are $\Delta y = 0.1 \text{ m}$ apart. What is the separation d of the slits? The light has a wavelength $\lambda = 6.5 \times 10^{-7} \text{ m}$.

Interference

Diffraction

The WorldView-4 satellite is a commercial satellite designed to take surveillance photographs for sale and has been active since 2014. The cost for photos from the satellite archive is as low \$14. The aperture of the camera on the satellite is $a = 1.1 \text{ m}$ and the satellite operates $L = 620 \text{ km}$ above the Earth. What is the size of the smallest object visible to the camera? Visible light covers a range of wavelengths of $\lambda \approx 400 - 700 \text{ nm}$. What is the size of the smallest object visible to human eyes?

A laser beam of wavelength $\lambda = 6328 \text{ \AA}$ is shone on a single slit of width $a = 1.0 \text{ mm}$. If a screen is placed a distance $L = 0.40 \text{ m}$ away, then how far from the central maximum is the first dark spot on each side of the central maximum? What is the angular size of the central peak?

$$I = I_m \left(\frac{\sin \alpha}{\alpha} \right)^2 = I_m \left(\frac{\sin \left(\frac{\pi a}{\lambda} \sin \theta \right)}{\frac{\pi a}{\lambda} \sin \theta} \right)^2$$

$$\alpha = \frac{\pi a}{\lambda} \sin \theta \quad \theta \equiv \text{angular position}$$

If

$$f(a) = g(a) = 0$$

and

$$\lim_{x \rightarrow a^+} \frac{f'(x)}{g'(x)} = A$$

then

$$\lim_{x \rightarrow a^+} \frac{f(x)}{g(x)} = A$$

Double-slit Interference, $a = 0.04\text{ mm}$, $d = 0.125\text{ mm}$

Single-slit Diffraction, $a = 0.04\text{ mm}$

Light of wavelength $\lambda = 600 \text{ nm}$ is incident normally on a diffraction grating in a spectrometer. Two adjacent maxima occur at angles given by $\sin \theta_1 = 0.2$ and $\sin \theta_2 = 0.3$. The fourth-order maxima are missing. What is the separation between adjacent slits?
